

Ideation Phase

Brainstorm & Idea Prioritization

Date	3 September 2026
Team ID	Individual Project
Student Name	Samudrala Sujana
Project Name	An Employee Requests Installation of Licensed Software through the Service Catalog
Maximum Marks	4 Marks

Project Overview

The Software Installation Request Automation project is designed to streamline how employees request, approve, and fulfill licensed software installations within an organization using ServiceNow. Instead of handling requests through emails or manual communication, employees submit a standardized request through the Service Catalog. The request then follows an automated flow for notification, approval, and fulfillment, improving efficiency, visibility, compliance, and user experience.

Brainstorm & Idea Prioritization:

This ideation activity identifies the main problem in the existing software request process, explores possible automation approaches, groups the ideas into solution areas, and prioritizes the most practical solution for implementation in ServiceNow.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

- Project Type: Individual Project
- Stakeholder perspective considered: Employee/Requester, Approver, IT Support/Fulfillment Team, and IT Governance.
- Selected Problem Statement:

Employees need a simple and standardized way to request installation of licensed software. Manual requests through email can cause delays, missing information, lack of request visibility, inconsistent approvals, and difficulty in ensuring licensing and governance compliance.

Business Objective:

- Reduce manual effort and eliminate delays in handling software installation requests.
- Accelerate approval and fulfillment through an automated workflow.
- Enforce a standardized request process and approval flow.
- Provide centralized visibility and tracking of requests.
- Improve the employee experience through transparent and faster service delivery.
- Support compliance with software licensing, IT governance, and security policies.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas:

- **Create a Service Catalog item:** Provide a single standardized form for employees to request software installation.
- **Capture required request details:** Collect Software Name, Version, License Justification, and Urgency.
- **Automate approval:** Use Flow Designer to send the request through an approval step before fulfillment.
- **Create a fulfillment task:** Automatically create a Catalog Task for the IT/Software Support team.
- **Send email notification:** Notify the requester when the software installation request is submitted.
- **Track request status:** Allow the request to be followed through Request, Requested Item (RITM), and Catalog Task records.
- **Maintain licensing information:** Require justification and version details to support governance and compliance.

Idea Grouping:

- **Request Management** – Service Catalog item and request variables.
- **Workflow Automation** – Email notification, approval, and catalog task creation.
- **Fulfillment** – Assignment of the installation task to the Software Support/IT Support team.
- **Visibility and Compliance** – Request tracking, justification, and standardized processing.

Step-3: Idea Prioritization

The ideas were prioritized based on business value, feasibility in ServiceNow, ease of implementation, and their contribution to reducing manual effort.

Idea	Business Value	Feasibility	Priority
Service Catalog request form	High	High	High
Automated approval flow	High	High	High
Create Catalog Task	High	High	High
Email notification trigger	Medium	High	High
Request status tracking	High	High	High
Advanced licensing integration	High	Medium	Future Enhancement

Selected Solution:

The prioritized solution is a ServiceNow-based Software Installation Request Automation system in which an employee submits a licensed software request through the Service Catalog. The implemented flow sends an email notification to the requester, requests approval, and creates a Catalog Task for fulfillment by the Software Support/IT Support team.

Implemented Project Flow

1. Employee opens the Software Installation Request from the Service Catalog.
2. Employee enters Software Name, Version, License Justification, and Urgency.
3. The request is submitted and ServiceNow generates the Request and Requested Item (RITM).
4. The Flow Designer automation sends an email notification confirming submission.
5. The request goes through the approval step.
6. After the workflow reaches fulfillment, a Catalog Task is created and assigned to the Software Support/IT Support team.
7. The requester and support team can track the request through the centralized ServiceNow records.

Skills Required

- Design Flow
- Business Rule Management Systems
- Table Functions
- Service Catalog

Software Requirements

- ServiceNow instance (Personal Developer Instance or Enterprise Instance)
- Flow Designer enabled
- Email Notification and Email Script support

Hardware Requirements

- Standard desktop or laptop computer
- Minimum 4 GB RAM (8 GB recommended)
- Stable internet connection

Expected Outcome

The project provides a standardized and automated method for managing licensed software installation requests. It reduces manual coordination, improves approval and fulfillment visibility, creates a clear audit trail, and enhances employee satisfaction through a transparent request process.
