

Ideation Phase

Define the Problem Statements

Date	3 September 2026
Team ID	Individual Project
Student Name	Samudrala Sujana
Project Name	An Employee Requests Installation of Licensed Software through the Service Catalog
Maximum Marks	2 Marks

Customer Problem Statement:

A customer problem statement helps identify the challenges faced by the people who use or interact with a service. For this project, the customer perspective is used to understand the difficulties employees and IT support teams face when software installation requests are handled manually.

A clearly defined problem statement helps in designing an appropriate ServiceNow solution that improves request submission, approval, fulfillment, visibility, and compliance.

PS-1: Employee / Requester Problem Statement

Customer Problem Statement - PS-1

I am	an employee requesting licensed software
I'm trying to	get software installed quickly through a simple process
But	the traditional request process can involve manual communication and poor visibility
Because	there is no single standardized and automated request workflow
Which makes me feel	frustrated, delayed, and uncertain about my request status

I am (Customer)	I'm trying to	But	Because	Which makes me feel
an employee requesting licensed software	request and receive software installation quickly	the traditional process can involve manual communication and limited tracking	there is no single standardized and automated request workflow	frustrated, delayed, and uncertain about the request status

PS-2: IT Support / Fulfillment Team Problem Statement

I am (Customer)	I'm trying to	But	Because	Which makes me feel
an IT Support team member responsible for software installation	manage and fulfill software installation requests efficiently	request details, approvals, and fulfillment activities can require manual coordination	software requests are not always handled through a centralized automated workflow	overloaded and less able to track requests efficiently

How the Proposed ServiceNow Solution Addresses These Problems

- A standardized Service Catalog item allows employees to submit software installation requests in one place.
- Request variables capture Software Name, Version, License Justification, and Urgency.
- Flow Designer automates the email notification, approval step, and creation of the Catalog Task.
- The Request (REQ), Requested Item (RITM), and Catalog Task provide centralized tracking and visibility.
- The structured process supports software licensing, IT governance, and compliance requirements.
