Proposed Solution

The following proposed solution is designed for automating licensed software installation requests using ServiceNow Service Catalog and Flow Designer.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employees often request software installation through emails or manual communication. This can cause delays, poor visibility, inconsistent approval handling, and difficulty in ensuring that only licensed and approved software is installed.
2	Idea / Solution Description	A standardized Service Catalog item is created in ServiceNow for software installation requests. Employees provide details such as software name, version, license justification, and urgency. The request triggers an automated flow that sends a confirmation email, requests approval, and creates a catalog task for the Software Support Team to fulfill.
3	Novelty / Uniqueness	The solution provides an end-to-end automated workflow by combining Service Catalog variables, dynamic approval processing, Flow Designer actions, catalog task creation, email notification, and centralized request tracking. It replaces fragmented manual coordination with one transparent workflow.
4	Social Impact / Customer Satisfaction	Employees receive a simple and transparent way to request licensed software and track the request lifecycle. Automation reduces waiting time and manual follow-ups, while approvals and task assignment improve compliance, accountability, and user satisfaction.
5	Business Model (Revenue Model)	This is an internal enterprise automation solution rather than a direct revenue-generating product. Its business value comes from reducing manual effort, minimizing processing delays, improving IT support productivity, and helping organizations avoid compliance and licensing risks. The same solution can also be adapted as a reusable ServiceNow implementation for organizations.
6	Scalability of the Solution	The solution can be scaled by adding more software categories, multiple approval levels, license validation, department-based routing, SLA tracking, additional notifications, dashboards, and integrations with software asset management or IT asset management systems.
